

BMAC Showcase New Light Technology at Eurobus Expo

BMAC exhibited at the Eurobus show earlier this month where we showcased our new '**light guide technology**' rear lights.

Light guide technology is an emerging lighting technology involving continuously illuminated LED pipes to create lighting solutions that allow greater design flexibility and functionality than traditional LEDs. The light generated by this technology is very homogenous and offers significant aesthetic advantages over the conventional 'points of light' seen in current LED lighting products.

The technology can be used for tail, stop and indicator applications as well as reverse and fog applications, putting it at the **cutting edge of automotive LED lighting technology**. The new rear LED lighting solution from BMAC will complement the 'front of bus pack', the **unique BMAC Opti-Lux LED** headlight which we launched a few months ago. For more information please email us: enquiries@bmac.ltd.uk.

We would like to take this opportunity to thank everyone who visited our stand this year and we are looking forward to seeing you again soon!
